Aggregating inertia

how lumpy, delayed revision aggregates — and what revision records reveal

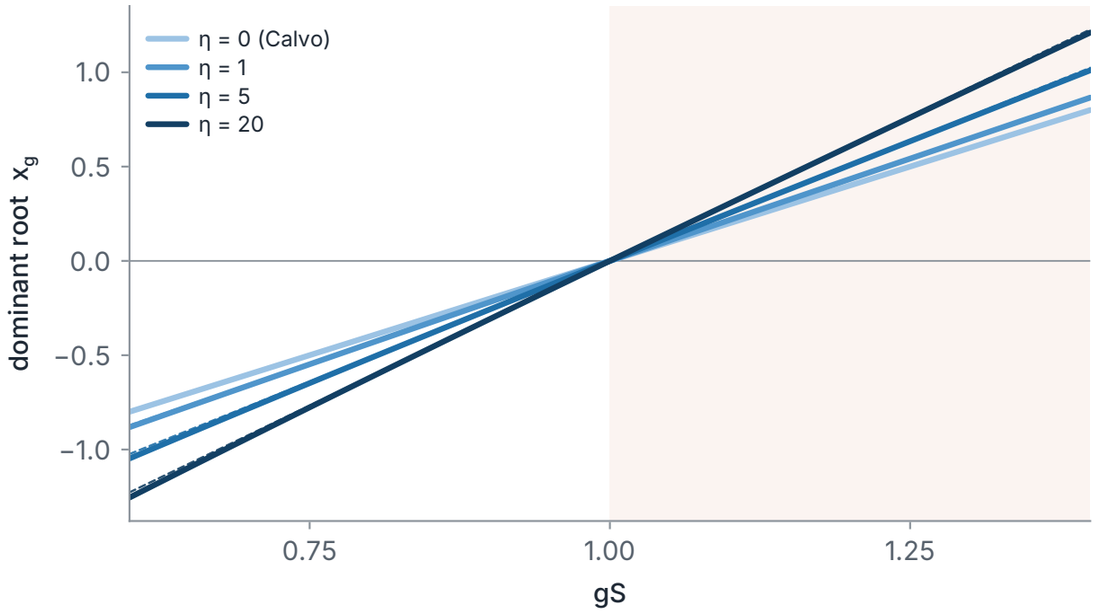

Tipping and lock-in

stable states (solid), unstable (dashed), 50,000 agents under a slow ramp

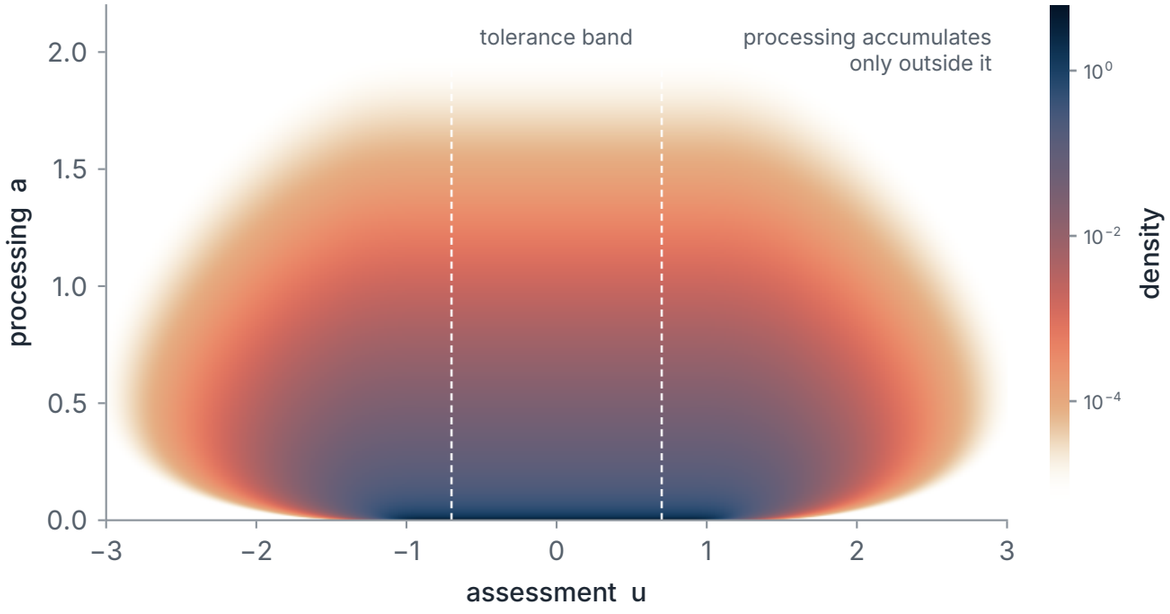

Critical slowing down

near the threshold the population moves at the rate (gS − 1) / mean lag

The hidden state

joint law of assessment and processing; 63% of agents sit at A = 0

One record, two economies

identical durations and revisions …

… different areas, so S differs
