
A. The response kernel
B. Location: transfer on the imaginary axis
C. Speed: critical slowing down
D. Shape: slow shift or tip
Response $k(t)$
Time t
$\eta = 0$
$\eta = 1$
$\eta = 5$ (Example 1)
$\eta = 20$
$\omega = 0$
$\omega \to \infty$
increasing ω
$\mathrm{Im}\,\hat{k}(i\omega)/S$
$\mathrm{Re}\,\hat{k}(i\omega)/S$
Dominant root x_g
disturbances grow
disturbances decay
dashed: $(gS-1)/\bar{L}$, $\eta = 0$ and $\eta = 20$
Feedback relative to the threshold, gS
Stationary average m
lock-in
hazard falling with $|u|$
hazard rising with $|u|$
Feedback relative to the threshold, gS
